SLIDE 1 OF 3

The Problem: Our Current Order Process Is a Bottleneck

Manual hardware order processing — analysis and pain points

CURRENT WORKFLOW

Email — Sales rep emails PDF order form to shared inbox

↓

Manual — Ops team member reads & interprets PDF manually

↓

Salesforce — Manually checks customer account status in Salesforce

↓

Sheets — Manually checks inventory levels in Google Sheets

↓

Decision — Is the account valid AND stock available?

YES ↓ Draft & send confirmation email to customer + fulfilment email to warehouse

NO ↓ Email sales rep to query → wait for reply → restart process (delays of hours/days)

⏱ Slow Processing

Each order takes 15-30 minutes of manual work across 4 systems.

⚠ Human Error

Misread PDFs, wrong inventory counts, and copy-paste mistakes.

🕑 Exception Delays

Problems trigger email chains that stall orders for hours or days.

📈 Not Scalable

More orders = more staff needed. Process doesn't scale linearly.

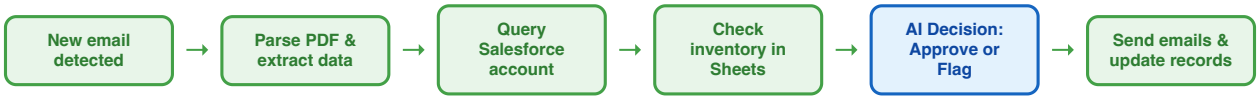
The Solution: Introducing 'OrderBot,' Our Autonomous AI Agent

An intelligent agent that handles the entire order workflow end-to-end

HOW ORDERBOT WORKS

AUTOMATED WORKFLOW



Autonomous Decision-Making

OrderBot analyses account status and inventory simultaneously. Valid orders are approved and fulfilled instantly. Exceptions are flagged with a clear summary for human review — no more email chains.

Continuous Learning

Every order is logged. Over time, OrderBot learns patterns — such as which sales reps submit incomplete forms — and proactively flags these for faster resolution. The system gets smarter with use.

The Business Impact & Recommended Next Steps

Projected benefits and a low-risk path to implementation

PROJECTED IMPACT

⚡

95%

Reduction in processing time
(from 25 mins to under 2 mins per order)

✅

99.5%

Target accuracy rate
(eliminating manual data entry errors)

💰

20+ hrs

Staff time freed per week
(redirected to higher-value work)

🚀

24/7

Processing capability
(orders handled outside business hours)

Recommended Next Steps: A Low-Risk Path to Automation

1. Phase 1 **Read-Only Proof of Concept (2 weeks):** Deploy OrderBot in observation mode. It reads and processes orders but takes no action — a human verifies its decisions. This validates accuracy with zero risk.
2. Phase 2 **Supervised Automation (4 weeks):** OrderBot processes orders autonomously but flags exceptions for human approval. Staff review a daily summary dashboard.
3. Phase 3 **Full Autonomy:** Once accuracy targets are consistently met, OrderBot operates independently with exception-only human intervention.
